

## 1 Features

### 1.1 Hardware

- High-performance, low-noise MEMS IMU
- Integrated low-noise, high-reliability LDO
- Vibration-resistant design for dynamic and vibration-prone environments
- Integrated temperature sensor
- Supports external GNSS
- Compact SMT package (15 × 15.2 × 2.6 mm), easy to integrate
- Product design complies with relevant RoHS requirements; materials meet halogen-free specifications; for certification status, please refer to the latest official information
- Provides multiple peripheral interfaces, including 4 × UART. Selected models support CAN. I2C/SPI interfaces are reserved but not supported by the current firmware
- Supports customization
- Some models provide multifunction I/O, which can be used for synchronization, LED, alarm, and other functions
- Some models support PPS + GPRMC time synchronization; refer to the selection table and pin definitions for details
- Factory-calibrated and compensated over the full temperature range of -40 °C to 85 °C, including bias, scale factor, and cross-axis calibration

### 1.2 Software

- Adaptive EKF fusion algorithm
- The UART output data rate supports up to 1000 Hz, depending on output type and configuration, with low output latency
- Optimized attitude tracking and vibration suppression performance for dynamic motion scenarios
- Can reduce the influence of linear acceleration on attitude estimation under typical operating conditions
- Supports serial binary protocol, CAN, Modbus, and other communication protocols
- Comprehensive user configuration commands
- Multifunctional GUI for easy operation
- Supports various examples for ROS1, ROS2, C, MATLAB, Python, Arduino, etc.

## 2 Applications

The HI06 series is designed for high-performance attitude sensing and complex operating conditions, and is suitable for attitude measurement and control scenarios under temperature variation, vibration, and dynamic motion conditions. Typical applications include:

- Platform stabilization and control
- Construction machinery
- Humanoid robots
- Unmanned aerial vehicles (UAVs)
- Low-speed autonomous robots
- Smart agricultural machinery

### 3 Description

#### 3.1 System Block Diagram

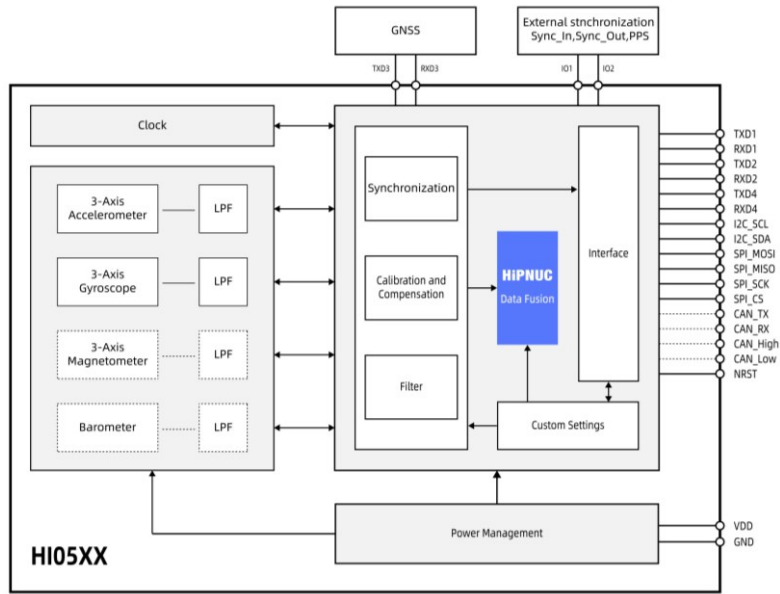

Figure 1: HI06 Series System Block Diagram

**Note 1:** Dashed lines indicate functions not supported by some models. Refer to Table 1: Product Selection Information for details.

#### 3.2 Description

The HI06 series is a MEMS-based IMU/VRU/AHRS/INS sensor module featuring proprietary adaptive EKF, IMU noise analysis, motion-state analysis, and GNSS fusion algorithms. It provides high-quality attitude, angular rate, and acceleration data, and for INS-capable models, position and velocity data with an external GNSS input.

Each module is factory calibrated and compensated for temperature, bias, scale factor, and cross-axis errors.

The module supports data communication over UART, and selected models also support CAN, with some requiring an external CAN transceiver. I2C and SPI interfaces are reserved but not supported by the current firmware. Models with synchronization capability support PPS + GPRMC time synchronization or trigger-based synchronization with external systems.

The multifunction GUI software supports rapid evaluation, including module configuration, data visualization, firmware upgrade, and data logging.

## 7 HI06 System Architecture

The HI06 series is a high-performance sensor module integrating IMU, VRU, AHRS, and INS functions. It undergoes strict scale factor, cross-axis, temperature, and bias calibration and testing before leaving the factory, and can provide users with raw sensor data (such as acceleration, angular velocity, and, for some models, geomagnetic field and air pressure), 3D orientation data (Euler angles, namely pitch, roll, and yaw), quaternion data, and more. For models supporting INS, velocity and position information can also be provided after connecting an external GNSS.

Depending on the model, the HI06 module may be equipped with a 3-axis accelerometer, 3-axis gyroscope, 3-axis magnetometer, barometer, and a high-performance processor. This processor is mainly used for sensor synchronization, calibration, algorithm fusion, and user configuration. In addition, based on application scenarios and sensor characteristics, we provide users with multiple operating modes, such as 6-DoF, AHRS, humanoid robot mode, etc. Refer to the Command and Programming Manual for details.

### 7.1 IMU

HI06 can be used as an inertial measurement unit (IMU) to provide users with precise 3D acceleration and 3D angular velocity data. These data are collected through the internally integrated high-precision accelerometer and gyroscope, and can reflect the motion state and dynamic changes of an object in three-dimensional space in real time. Compared with traditional IMU chips, the significant advantage of HI06 is that it has undergone strict calibration and compensation correction before leaving the factory, greatly improving the accuracy and stability of the output data. These calibrations include cross-axis, scale factor, bias, and temperature.

### 7.2 VRU

Through our self-developed algorithm fusion engine, HI06 can deeply process and optimize basic IMU data, thereby outputting high-precision 3D orientation data based on the gravity reference frame. These orientation data include pitch, roll, and yaw, providing users with intuitive and reliable attitude information support.

### 7.3 AHRS

Based on IMU and VRU, HI06 is further upgraded into a more powerful attitude and heading reference system (AHRS) by introducing a high-precision, wide-range TMR (tunnel magnetoresistance) 3-axis magnetometer. This upgrade significantly enhances HI06's attitude sensing capability, enabling it to provide users with more comprehensive and accurate attitude data, including long-term stable pitch, roll, and yaw based on magnetic north reference.

### 7.4 INS

By connecting an external global navigation satellite system (GNSS) module, the HI06 series sensor can be upgraded into a powerful inertial navigation system (INS) module. By combining the high-precision positioning capability of GNSS with the inertial measurement data of the built-in IMU in HI06, the INS module can output multiple types of high-precision data, including:

**Velocity information:** The INS module can output real-time velocity data of the object in three-dimensional space. Combined with GNSS signals and inertial measurement data, it can provide accurate velocity change information, suitable for dynamic motion analysis and navigation scenarios.

**Position information:** Through GNSS global positioning, the INS module can obtain the geographic position coordinates of the object (longitude, latitude, altitude, etc.) in real time. The fusion with inertial measurement data can also compensate for GNSS signal loss for a short period of time, thereby ensuring continuity of position information.

**Attitude information:** Under the combined action of IMU and GNSS data, the INS module can provide high-precision 3D attitude

data, including pitch, roll, and yaw. These attitude data are optimized by algorithms and feature excellent dynamic response performance and anti-interference capability, making them suitable for aircraft, UAVs, vehicle navigation, and other scenarios requiring precise attitude sensing.

Timing information: The INS module can provide high-precision time synchronization information through GNSS signals. This is particularly important in applications requiring strict time synchronization, such as communication base stations, navigation systems, and scientific experiments.

In addition, through factory calibration and fusion algorithm optimization, drift accumulation common in inertial navigation can be suppressed to a certain extent, and short-term continuous navigation capability can be provided in scenarios where GNSS is temporarily blocked.

### 8 Pin Definitions

Figure 3: HI06XX-MI0 Pin Definitions

Table 6: MI0 Pin Function Description

| Pin Number | Pin Name         | Type  | Functional  | Remark |
|------------|------------------|-------|---|--------|
| 1          | IO1(SYNC_IN/PPS) | I/O   | Synchronization input, can accept external trigger signals such as GNSS PPS signal                          |        |
| 2          | IO2(SYNC_OUT)    | I/O   | Synchronization output, can be used as Data Ready signal  |        |
| 3          | UART4_TX         | I/O   | UART4 transmit  |        |
| 4          | UART4_RX         | I/O   | UART4 receive   |        |
| 5          | GND              | Power | Power ground  |        |
| 6          | VDD              | Power | Power input 3.2 V ~ 5.0 V   |        |
| 7          | NRST             | I     | Reset pin, low level resets the module; recommended to connect to host GPIO; may be left floating if unused |        |
| 8          | UART1_TX         | I/O   | UART1 transmit  |        |
| 9          | UART1_RX         | I/O   | UART1 receive   |        |
| 10         | UART3_TX/I2C_SCL | I/O   | UART3 transmit, can connect to external GNSS module / I2C clock signal                                      |        |
| 11         | UART3_RX/I2C_SDA | I/O   | UART3 receive, can connect to external GNSS module / I2C data signal  |        |
| 12         | UART2_TX         | I/O   | UART2 transmit  |        |
| 13         | UART2_RX         | I/O   | UART2 receive   |        |
| 14         | SPI_CS           | I/O   | SPI chip select signal  |        |
| 15         | SPI_SCK          | I/O   | SPI clock signal  |        |
| 16         | SPI_MISO         | I/O   | SPI data output signal (slave)  |        |
| 17         | SPI_MOSI         | I/O   | SPI data input signal (slave)   |        |
| 18         | CAN_RX           | I/O   | CAN receive signal  |        |
| 19         | CAN_TX           | I/O   | CAN transmit signal   | 1      |

**Note 1:** If CAN is used, an external CAN transceiver is required, such as TJA1044.

Table 7: UART Function Description

| Port  | Data Transmission | Command Configuration | GPRMC/UTC | RTCM | GNSS | Firmware Upgrade |
|-------|-------------------|-----------------------|-----------|------|------|------------------|
| UART1 | √                 | √                     | √         | ×    | ×    | √                |

## 9 Interfaces and Reference Designs

### 9.1 Power Supply

The module integrates an LDO to suppress the impact of input power noise on internal analog and digital circuits. The recommended input voltage range is 3.2 V ~ 5.0 V. For the operating voltage range, refer to 11.1 Electrical Parameters. External power supply can use LDO or DC/DC.

Figure 4: HI06 Power Supply Reference Circuit

### 9.2 UART

The HI06 series sensor supports flexible and diverse communication methods, and can communicate through UART1/UART2 in full-duplex mode. By default, the communication frame format is standard 8N1 mode, namely:

- Baud rate: 115200 bps (adjustable as needed)
- Data bits: 8 bits
- Parity: none
- Stop bits: 1 bit

This communication configuration is a standard configuration in industrial applications, with strong compatibility, and can seamlessly interface with most embedded systems, industrial control devices, robot controllers, etc.

In addition, HI06 can also expand the UART interface into RS-485 or RS-422 communication by adding external RS-485 or RS-422 transceivers, further enhancing the applicability and scalability of the module.

**Note 1:** Both baud rate and data output frame rate can be modified through commands. Refer to the Command and Programming Manual for details.

When using the HI06 series sensor for UART communication, it is recommended that the logic level of the user's processor be 3.3 V. If communication with a processor of 5 V or 1.8 V logic level is required, the user needs to add a level shifting chip to ensure reliable communication and device safety.

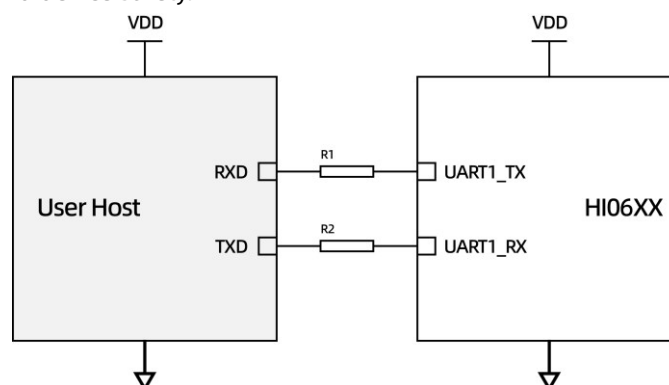

Figure 5: HI06 UART Communication Minimum System Reference Circuit

## 9.3 I2C

Not supported by the current firmware version. Planned for support in future versions.

## 9.4 SPI

Not supported by the current firmware version. Planned for support in future versions.

## 9.5 CAN

Models supporting CAN can implement the standard CAN 2.0B communication protocol. The default baud rate is 500 kbps, which can meet the needs of most industrial and embedded applications. Users can also modify the baud rate through commands to adapt to different communication scenarios. Refer to the Command and Programming Manual for details.

## 9.6 Typical CAN Reference Design

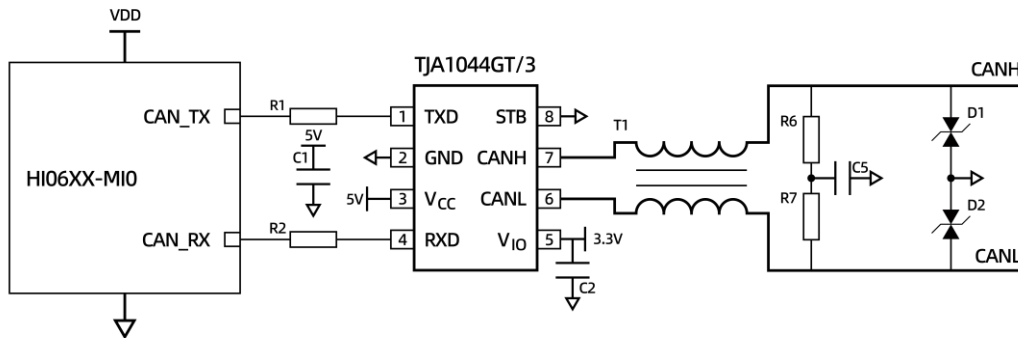

Figure 6: HI06XX-MIO CAN Communication Circuit Reference

**Note 1:** Baud rate, ID, etc. can be modified through commands. Refer to the Command and Programming Manual for details.

**Note 2:** Terminal resistor configuration should be determined according to the system bus topology. R6/R7 in the reference circuit are for design reference only.

## 9.7 Synchronization

HI06 models supporting synchronization can implement pulse-trigger synchronization and PPS + GPRMC time synchronization, and can perform time alignment with the host or external devices (such as GNSS, cameras, radars, etc.). Refer to Table 3 for specific support.

### 9.7.1 HI06 Host-Triggered Synchronization (UART)

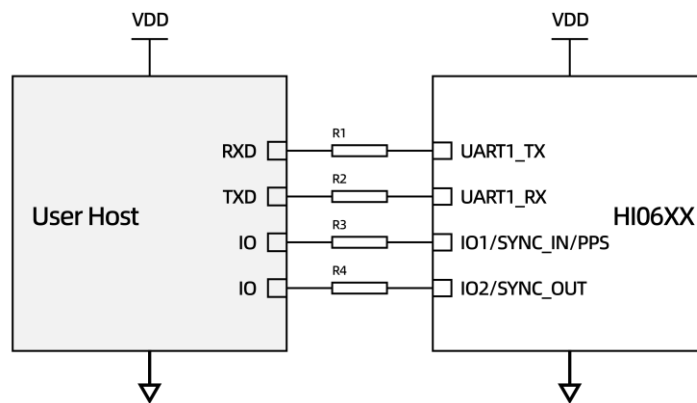

Figure 7: HI06 Host-Triggered Synchronization (UART Communication)

In this connection method, the user needs to directly connect IO1/IO2 to the host system for trigger synchronization between systems. If IO1 is used as synchronization input, then IO1 is in synchronization input mode, and the host needs to generate pulses with the same frequency as the data frame rate and send them to HI06. If IO2 is used, then IO2 needs to be in

synchronization output mode, and the synchronization output pulse has the same frequency as the data frame rate and can be used as a Data Ready signal. IO1 and IO2 do not have to be used at the same time. The user can choose which synchronization method to use according to the specific system.

**9.7.2 Host PPS + GPRMC Time Synchronization (UART)**

In this connection method, the user needs to directly connect IO1/IO2 to the host system for inter-system time synchronization. At this time, IO1 is in synchronization input PPS mode, and the host needs to generate a PPS pulse per second to HI06. If IO2 is used, then IO2 needs to be in synchronization output mode, and the synchronization output pulse has the same frequency as the data frame rate and can be used as a Data Ready signal. UART1\_RX shall receive the GPRMC message generated by the host.

**9.7.3 External Device PPS + GPRMC Synchronization (UART)**

HI06 can perform PPS + GPRMC time synchronization with external devices. The external device needs to generate PPS and RMC information. At this time, note that HI06, the user host, and GNSS must share a common ground. IO1 is responsible for receiving the PPS pulse signal generated by the external device, and UART2\_RX/UART3\_RX receives the RMC information.

Figure 8: HI06 and External Device PPS + GPRMC Synchronization

**9.7.4 CAN (Synchronization)**

In CAN communication scenarios, synchronization can also be implemented. At this time, HI06 communicates with the host through the CAN interface, and the synchronization I/O can continue to be used for external triggering or time alignment. For specific synchronization timing and configuration methods, refer to the UART synchronization method.

## 9.8 INS System

The HI06NX series can connect external GNSS to implement an INS system, providing users with attitude, position, velocity, timing, and other information. UM982 is used here as an example to describe how HI06NX connects to external GNSS.

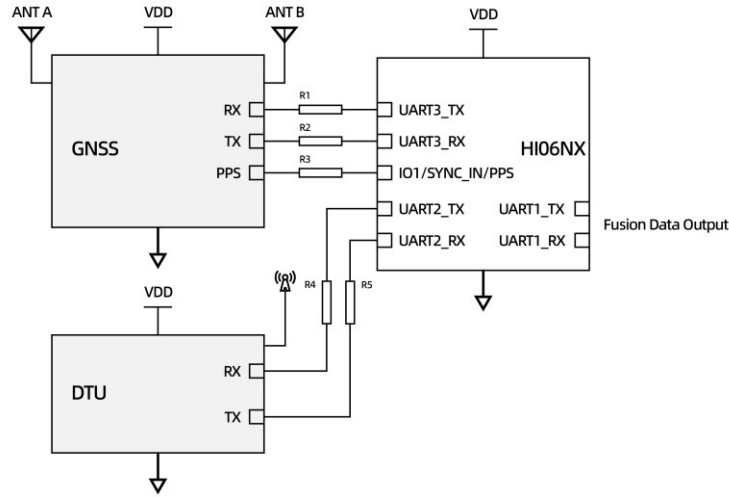

Figure 9: HI06NX with External GNSS

**Note 1:** DTU is not a necessary system element. Users may choose whether to add DTU according to their system design requirements.

## 9.9 Reference Design BOM

Table 8: Reference Design BOM

| Item         | Reference      | Part   | P/N                 | Vendor     |
|--------------|----------------|--|---------------------|------------|
| Fuse         | F1             | 300 mA   | JK-SMD0603-030-6    | JK         |
| TVS          | D3             | SMF5.0CA   | SMF5.0CA            | Littelfuse |
| Resistor     | R1,R2,R3,R4,R5 | 1 k $\Omega$   | RC0402JR-071KL      | YAGEO      |
| Resistor     | R6,R7          | 60.4 $\Omega$  | RC1206FR-0760R4L    | YAGEO      |
| Capacitor    | C1,C2          | 0.1 $\mu$ F  | CC0402KRX5R7BB104   | YAGEO      |
| Capacitor    | C5             | 1 nF   | CC0402KRX7R9BB102   | YAGEO      |
| Common Choke | T1             | 5.8 k $\Omega$ @ 10 MHz, 100 $\mu$ H @ 100 kHz, 150 mA | ACT45B-101-2P-TL003 | TDK        |
| TVS          | D1,D2          | SMBJXXCA   | SMBJXXCA            | Littelfuse |

**Note 1:** Series resistors may be matched according to communication distance, rate, and system immunity requirements. Typical options are 33  $\Omega$ , 100  $\Omega$ , or 1 k $\Omega$ .

**Note 2:** The voltage rating of the TVS device should be selected according to the system power platform. In multi-node cascaded scenarios, SMAJ series devices may also be selected.

## 10 Sensor Specifications

### 10.1 Gyroscope

Table 9: Gyroscope Specifications

| Parameter               | Condition          | Min | Typ    | Max   | Unit    | Remark                  |
|-------------------------|--------------------|-----|--------|-------|---------|-------------------------|
| Range                   |                    |     | ±250   |       |         |                         |
|                         |                    |     | ±500   |       |         |                         |
|                         |                    |     | ±1000  |       | °/s     | Default: ±2000          |
|                         |                    |     | ±2000  |       |         |                         |
|                         |                    |     | ±4000  |       |         |                         |
| Resolution              |                    |     | 16     | 20    | bit     |                         |
| Scale Factor Error      | 100 °/s before SMT |     | 250    | 400   | ppm     | Typical: RMS            |
|                         | 100 °/s after SMT  |     | 1200   | 2000  |         |                         |
| Nonlinearity            |                    |     | ±0.05  |       | %FS     | 1                       |
| Noise Density           | Bandwidth 10 Hz    |     | 0.0025 |       | °/s/√Hz |                         |
| 3 dB Bandwidth          |                    |     | 80     | 400   | Hz      | 2                       |
| Zero-rate Output        |                    |     |        | ±0.12 | °/s     | 3                       |
| Sampling Rate           |                    |     | 1000   |       | Hz      |                         |
| Bias Instability        | Allan Variance     | X   | 0.9    | 1.5   |         | Typical: 1σ;<br>Max: 3σ |
|                         |                    | Y   | 1.1    | 1.4   | °/h     |                         |
|                         |                    | Z   | 1.0    | 1.5   |         |                         |
| Bias Stability          | 10 s Average       | X   | 3.1    | 5     |         | Typical: 1σ;<br>Max: 3σ |
|                         |                    | Y   | 2.9    | 4.5   | °/h     |                         |
|                         |                    | Z   | 3.0    | 6.5   |         |                         |
| Bias Repeatability      |                    | X   | 7      | 18    |         |                         |
|                         |                    | Y   | 6      | 19    | °/h     |                         |
|                         |                    | Z   | 6      | 13    |         |                         |
| Angle Random Walk (ARW) | Allan Variance     | X   | 0.055  | 0.07  |         | Typical: 1σ;<br>Max: 3σ |
|                         |                    | Y   | 0.057  | 0.07  | °/√h    |                         |
|                         |                    | Z   | 0.059  | 0.07  |         |                         |
| Bias Temperature Drift  | -40 °C ~ 85 °C     |     | 0.07   | 0.15  | °/s     | 4                       |
| g - Sensitivity         | XYZ                |     | 0.05   |       | °/s/g   |                         |

**Note 1:** Maximum deviation from the best-fit straight line within the specified range.

**Note 2:** Different modes have different bandwidths. The default 6-DoF mode is 80 Hz.

**Note 3:** After initial bias calibration, bias can be estimated in real time by the algorithm engine.

**Note 4:** Measured in Hipnuc laboratory environmental chamber and turntable, with heating ramp rate less than 3 °C/min.

## 10.2 Accelerometer

Table 10: Accelerometer Parameters

| Parameter              | Condition                     | Min | Typ    | Max   | Unit   | Remark                  |
|------------------------|-------------------------------|-----|--------|-------|--------|-------------------------|
| Range                  |                               |     | ±2     | 20    | g      | Default: ±16            |
|                        |                               |     | ±8     |       |        |                         |
|                        |                               |     | ±16    |       |        |                         |
|                        |                               |     | ±32    |       |        |                         |
| Resolution             |                               |     | 16     |       | bit    |                         |
| Initial Bias           | Before SMT, horizontal static |     | 1      | 2     | mg     | Typical: RMS            |
|                        | After SMT, horizontal static  |     | 5      | 10    |        |                         |
| Nonlinearity           |                               |     | 0.01   |       | %FS    | 1                       |
| 3 dB Bandwidth         |                               |     | 90     | 400   | Hz     | 2                       |
| Noise Density          | Bandwidth 10 Hz               |     | 0.05   | 0.07  | mg/√Hz |                         |
| Sampling Rate          |                               |     | 1000   |       | Hz     |                         |
| Bias Instability       | Allan Variance                | X   | 0.0045 | 0.006 | mg     | Typical: 1σ;<br>Max: 3σ |
|                        |                               | Y   | 0.0065 | 0.009 |        |                         |
|                        |                               | Z   | 0.01   | 0.014 |        |                         |
| Bias Stability         | 10 s Average                  | X   | 0.011  | 0.015 | mg     | Typical: 1σ;<br>Max: 3σ |
|                        |                               | Y   | 0.018  | 0.023 |        |                         |
|                        |                               | Z   | 0.03   | 0.05  |        |                         |
| Bias Repeatability     | Allan Variance                | X   | 0.06   | 0.18  | mg     | Typical: 1σ<br>Max: 3σ  |

|                        |                               | Z   | 0.06   | 0.125 |        |                         |
| Velocity Random Walk   | Allan Variance                | X   | 0.009  | 0.01  | m/s/√h | Typical: 1σ;<br>Max: 3σ |
|                        |                               | Y   | 0.01   | 0.012 |        |                         |
|                        |                               | Z   | 0.012  | 0.014 |        |                         |
| Bias Temperature Drift | -40 °C ~ 85 °C                | XY  | 2      | 5     | mg     | 3                       |
|                        |                               | Z   | 6      | 15    |        |                         |

**Note 1:** Maximum deviation from the best-fit straight line within the specified range.

**Note 2:** Different modes have different bandwidths; the default 6-DoF mode bandwidth is 90 Hz.

**Note 3:** Tested on the temperature chamber turntable of Hipnuc Laboratory, with a temperature rise rate less than 3 °C/min.

### 10.3 Magnetometer

Table 11: Magnetometer Specifications

| Parameter    | Condition | Min  | Typ   | Max | Unit | Remark |
|--------------|-----------|------|-------|-----|------|--------|
| Range        |           |      | ±2000 |     | μT   |        |
| Noise        |           | 0.19 | 0.45  |     | μT   |        |
| Nonlinearity |           | ±10  | ±20   |     | μT   |        |

### 10.4 Temperature Sensor

Table 12: Temperature Sensor Specifications

| Parameter    | Condition | Min | Typ | Max | Unit | Remark |
|--------------|-----------|-----|-----|-----|------|--------|
| Range        |           | -40 | -   | 85  | °C   |        |
| Offset Error |           |     | ±5  |     | °C   |        |

### 10.5 Fusion Accuracy

Unless otherwise specified, the following fusion accuracy data are measured after factory calibration under typical installation conditions. Attitude accuracy is related to installation flatness, mechanical stress, vibration environment, linear acceleration, magnetic field environment, and user calibration status. Actual application results may vary.

#### 10.5.1 Attitude Angle Accuracy

Table 13: Attitude Angle Accuracy

| Parameter                      | Condition                  | Min | Typ  | Max  | Unit | Remark |
|--------------------------------|----------------------------|-----|------|------|------|--------|
| Pitch/Roll (Static)            | Before SMT                 |     | 0.08 | 0.12 | °    | 1      |
|                                | After SMT                  |     | 0.2  | 0.4  |      |        |
| Pitch/Roll (Dynamic)           | Before SMT                 |     | 0.1  | 0.2  | °    |        |
|                                | After SMT                  |     | 0.3  | 0.5  |      |        |
| Heading (AHRS)                 |                            |     | 2    | 3    | °    | 2      |
| Heading Static Drift (6-DoF)   | Static 2 h                 |     | 0.15 | 0.2  | °    |        |
| Heading Rotation Error (6-DoF) | 100°/s rotation before SMT |     | 0.2  | 0.1  | 0.3  | 3      |
|                                | 100°/s rotation after SMT  |     | 0.4  | 0.3  | 0.5  |        |

**Note 1:** Data are referenced to the calibration plane and obtained from 20 pcs test samples.

**Note 2:** Measured after magnetometer calibration and in the absence of surrounding magnetic interference; the product needs to be configured to AHRS mode.

**Note 3:** Average per-turn error over 10 turns on a turntable.

#### 10.5.2 INS Accuracy with External GNSS

Table 14: INS Accuracy with External GNSS

| Outage Time | Position Accuracy RMS | Velocity Accuracy RMS | Attitude Accuracy RMS |         |
|-------------|-----------------------|-----------------------|-----------------------|---------|
|             |                       |                       | Pitch/Roll            | Heading |
| 3 s         | 3 cm                  | 0.03 m/s              | 0.15°                 | 0.1°    |
| 10 s        | 30 cm                 | 0.1 m/s               | 0.2°                  | 0.15°   |
| 60 s        | 3 m                   | 0.15 m/s              | 0.2°                  | 0.25°   |

**Note 1:** Before GNSS outage, the module is in RTK positioning mode; after outage, odometer input is available; the external GNSS model is UM982.

## 11 System and Electrical Specifications

### 11.1 Electrical Specifications

Table 15: Electrical Specifications

| Parameter                   | Condition | Min  | Typ | Max | Unit | Remark |
|-----------------------------|-----------|------|-----|-----|------|--------|
| Operating Voltage Range VDD |           | 3.2  | -   | 5.5 | V    |        |
| Power Consumption           | HI06R2/N2 |      |     | 195 |      |        |
|                             | HI06R3/N3 |      |     | 200 | mW   |        |
|                             | HI06R4/N4 |      |     | 205 |      |        |
| V <sub>OL</sub>             |           |      |     | 0.4 | V    |        |
| V <sub>OH</sub>             |           | 2.6  |     |     | V    |        |
| V <sub>IL</sub>             |           | -0.3 |     | 1   | V    |        |
| V <sub>IH</sub>             |           | 1.9  |     | 3.6 | V    |        |

### 11.2 Interface Specifications

Table 16: Interface Specifications

| Interface   | Parameter            | Min  | Typ    | Max    | Unit | Remark                                       |
|-------------|----------------------|------|--------|--------|------|--|
| UART1/UART2 | Baud Rate            | 9600 | 115200 | 921600 | bps  |  |
|             | Output Data Rate     | 0    | 100    | 1000   | Hz   |  |
| UART3       | Baud Rate            |      | 115200 |        | bps  | Compatible with different GNSS module models |
|             | Baud Rate            | 125  | 500    | 1000   | kbps |  |
| CAN         | Output Data Rate     | 0    | 100    | 200    | Hz   |  |
|             | Differential Voltage |      | 1.5    | 3      | V    |  |
|             | Termination Resistor |      | None   |        |      |  |
| I2C         |                      |      |        |        |      | Not supported by current firmware            |
| SPI         |                      |      |        |        |      | Not supported by current firmware            |

### 11.3 System Specifications

Table 17: System Specifications

| Parameter                        | Condition    | Value  | Remark |
|----------------------------------|--------------|--|--------|
| Dimensions                       |              | 15 × 15.2 × 2.6 mm   |        |
| Weight                           |              | < 1.5 g  |        |
| System Start-up Time             | IMU/VRU/AHRS | 2 s  | 1      |
|                                  | INS          | 30 s   |        |
| Operating Temperature            |              | -40 °C ~ 85 °C   |        |
| Shell Material                   |              | Nickel Silver  |        |
| Vibration Resistance             |              | 1.0 mm (10 Hz ~ 58 Hz), ≤20 g (58 Hz ~ 600 Hz)   |        |
| Environmental Compliance         |              | Complies with relevant RoHS requirements   |        |
| Compliant materials              |              | Refer to the latest official information for relevant certification and compliance documents |        |
| Drop Test                        |              | Free drop 3 times from a 75 cm lab bench   |        |
| Temperature Shock Test           |              | Temperature rises from -40 °C to 85 °C within 1 h, repeated 5 times                          |        |
| Moisture Sensitivity Level (MSL) |              | MSL2   |        |

**Note 1:** Time from power-on to valid data output. For the first startup of the INS system, it depends on the time required for GNSS to enter positioning mode, generally < 30 s.

## 11.4 Absolute Maximum Ratings

Table 18: Absolute Maximum Ratings

| Parameter              | Limit           | Comment           |
|------------------------|-----------------|-------------------|
| Mechanical Shock       | 2000 g          | Duration < 0.2 ms |
| Storage Temperature    | -40 °C ~ 125 °C |                   |
| ESD (Human Body Model) | 2 kV            | JEDEC/ESDA JS-001 |
| Input Voltage          | 9 V             |                   |
| I/O to Ground Voltage  | -0.3 V ~ 5 V    |                   |

## 12 Mechanical Dimensions

All dimensions are in mm.

### 12.1 Product Dimensions

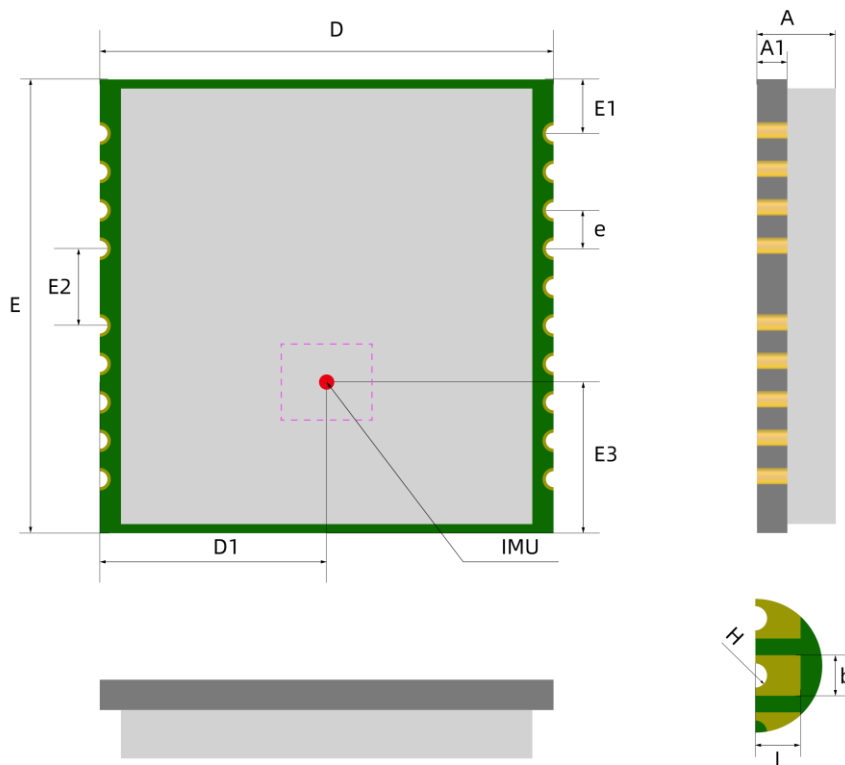

Figure 10: HI06 Mechanical Dimensions and IMU Position

Table 19: Product Dimension Data

| Symbol | Min (mm) | Typ (mm) | Max (mm) |
|--------|----------|----------|----------|
| A      | 2.5      | 2.6      | 2.7      |
| A1     | 0.95     | 1        | 1.05     |
| D      | 14.8     | 15       | 15.2     |
| D1     | 7.45     | 7.5      | 7.55     |
| E      | 15       | 15.2     | 15.4     |
| E1     | 1.69     | 1.885    | 2.1      |
| E2     | 2.5      | 2.54     | 2.55     |
| E3     | 4.9      | 5        | 5.1      |
| e      | 1.25     | 1.27     | 1.28     |
| L      | 0.95     | 1        | 1.05     |
| b      | 0.87     | 0.9      | 0.92     |
| H      | R0.26    | R0.27    | R0.28    |

12.2 Recommended Footprint Dimensions

Figure 11: HI06 Recommended Footprint Dimensions

**Note 1:** Exposed copper is prohibited on the back side of the device. If the user uses an HI06 with magnetometer function, copper pouring and routing are prohibited in the shaded area.

Table 20: HI06 Recommended Footprint Dimensions

| Symbol | Min(mm) | Typ(mm) | Max(mm) |
|--------|---------|---------|---------|
| D      |         | 15      |         |
| D1     |         | 5       |         |
| D2     |         | 5       |         |
| E      |         | 15.2    |         |
| E1     |         | 1.885   |         |
| E2     |         | 2.54    |         |
| E3     |         | 5       |         |
| e      |         | 1.27    |         |
| b      |         | 0.9     |         |
| L      |         | 2       |         |
| L1     |         | 1       |         |

## 13 Coordinate System

### 13.1 IMU/VRU/AHRS Coordinate System

#### 13.1.1 ENU (Default)

The body frame uses the right-forward-up (RFU) coordinate system, and the navigation frame uses the east-north-up (ENU) coordinate system. The accelerometer and gyroscope axis directions are shown in the figure below:

Figure 12: HI06 Coordinate System

The positive direction of angular velocity follows the right-hand rule. The quaternion output order is defined in the Command and Programming Manual. The Euler angle outputs correspond to yaw, pitch, and roll, and the rotation order uses the Z-X-Y (312) convention. For definitions involving intrinsic/extrinsic rotations and coordinate transformations, refer to the Command and Programming Manual. The specific definitions are as follows:

- Rotation about Z-axis: Yaw, range:  $-180^{\circ} \sim 180^{\circ}$
- Rotation about X-axis: Pitch, range:  $-90^{\circ} \sim 90^{\circ}$
- Rotation about Y-axis: Roll, range:  $-180^{\circ} \sim 180^{\circ}$

When the module coordinate system coincides with the reference coordinate system, the ideal Euler angle outputs are Pitch =  $0^{\circ}$ , Roll =  $0^{\circ}$ , and Yaw =  $0^{\circ}$ .

For coordinate system rotation, refer to the Command and Programming Manual.

#### 13.1.2 NWU and NED

The carrier can also be configured to the north-west-down (NWD) / north-east-down (NED) coordinate system. This needs to be configured by the user. Refer to the Command and Programming Manual for details.

### 13.2 INS System Coordinate System

The following coordinate and installation definitions apply to INS systems in which HI06NX is used together with a supported external GNSS module. If the external GNSS solution provides dual-antenna heading, antenna A and antenna B shall be installed according to the GNSS module requirements and the system coordinate definition described below. HI06 itself does not integrate GNSS antennas.

In a dual-antenna GNSS system, the two external GNSS antennas are defined as antenna A and antenna B according to the GNSS module or system labeling. A is the main antenna (positioning antenna), and B is the slave antenna (heading antenna). The vector determined by antennas A and B (from A to B) is called the heading baseline. The angle between the vector determined by antennas A and B and the forward direction of the carrier (positive IMU Y-axis direction) must be 0° (clockwise is positive). The recommended antenna spacing is between 0.8 m and 2 m. Note that after antenna position installation is completed, the module needs to be powered on again or restarted.

Figure 13: HI06 External GNSS Coordinate System Definition

**Note 1:** The antennas in the figure are only installation illustrations. Actual connection to the GNSS module is required.

## 14 Evaluation Board and Cabling

Figure 14: HI06 Series Evaluation Board and Cable

**Note 1:** For details, refer to the EVAL HI06 Evaluation Board User Guide.

## 15 Communication Protocols

### 15.1 Serial Binary Protocol

The product supports a serial binary communication protocol. For specific message formats, output configuration, and command definitions, refer to the Command and Programming Manual.

### 15.2 Modbus

By adding an external RS-485 transceiver, Modbus RTU-based communication can be supported. For detailed protocol information, refer to the Command and Programming Manual.

### 15.3 CAN

CAN communication supports CANopen and SAE J1939. For detailed protocol definitions, refer to the Command and Programming Manual.

## 16 Soldering and Installation

### 16.1 Reflow Profile

Figure 15: SMT Temperature Profile

Table 21: Reflow Profile Description

| Parameter  | Description  |
|--|--------------|
| Average ramp-up rate (TSmax to TP)               | 3 °C/s max   |
| Temperature min (TSmin)                          | 150 °C       |
| Temperature max (TSmax)                          | 200 °C       |
| Time (TSmin to TSmax)                            | 60-180 s     |
| Temperature (TL)                                 | 170 °C       |
| Time (tL)  | 60-150 s     |
| Peak classification temperature (TP)             | 250 °C       |
| Time within 5 °C of actual peak temperature (tp) | 20-40 s      |
| Ramp-down rate                                   | 6 °C/min max |
| Time 25 °C to peak temperature                   | 8 min max    |

### 16.2 Installation Recommendations

MEMS sensors are high-precision measurement devices that include both electronic structures and mechanically sensitive structures. In order to obtain better measurement accuracy, assembly consistency, and mechanical reliability, users are advised to pay attention to the following during PCB design and system installation:

- For models with magnetometer, keep them away from motors, inductors, high-current loops, ferromagnetic materials, and magnetic fasteners as much as possible to reduce the influence of magnetic interference on heading accuracy
- It is recommended to mount the module horizontally on the measured carrier.
- It is not recommended to place the sensor directly under or next to button contacts, as this will cause mechanical stress.
- It is not recommended to place the sensor directly near high-temperature hotspots (e.g., controllers or graphics chips), as this will cause rapid temperature rise of the PCB and thus heat up the sensor.
- It is not recommended to place the sensor near areas with maximum mechanical stress (e.g., at the center of diagonal intersections). Mechanical stress can cause bending of the PCB and the sensor.

- It is not recommended to mount the sensor too close to screw holes. Avoid mounting the sensor in areas where the PCB may or is expected to resonate (vibrate).

If limited by the system structure and the above installation recommendations cannot be fully met, it is recommended to perform online offset or installation error compensation calibration for the specific application after complete system assembly, so as to reduce potential impact.

## 17 Packaging

### 17.1 Tape

Figure 16: Tape Dimensions and Pin 1 Orientation

Table 22: Tape Dimensions

| Device | A0 (mm) | B0 (mm) | K0 (mm) | P1 (mm) | W (mm) |
|--------|---------|---------|---------|---------|--------|
| HI06   | 15.4    | 15.4    | 2.9     | 20      | 24     |

### 17.2 Reel

Figure 17: Reel Dimensions

Table 23: Reel Dimensions

| Device | SPQ(pcs) | Reel Diameter C1(mm) | Reel Width H(mm) | A(mm) | B(mm) | T(mm) | D(mm) |
|--------|----------|----------------------|------------------|-------|-------|-------|-------|
| HI06   | 1000     | 330                  | 16.8             | 2.5   | 11    | 2.0   | 100   |

### 17.3 Packaging Method

The HI06 series uses standard carton packaging.

Table 24: Packing Configuration

Table 25: Carton Dimensions

| Device | SPQ(pcs) | L (mm) | W (mm) | H (mm) |
|--------|----------|--------|--------|--------|
| HI06   | 1000     | 360    | 360    | 40     |
